Karl Ernst August Weihe scrip.

C. L. Zeyher, J. F. Drège, J. Ecklon and Ecklon & Zeyher have collected plants at the Cape of Good Hope, of which many specimens are in their Collection. See about them Linnaea XIX. p. 583 and XX. p 181.

The numbers in brackets on the labels designate the first (1–106) the Localities, which see in Linnaea XIX. 584, the second (1–12) the month of the year when collected. See also

MISSOURI BOTANICAL GARDEN

JUNCUS CANALICULATUS, n. sp.—A coarse plant of the section *Graminei*, 3 feet or more high from a cespitose rootstock with stout terete stems and numerous concave or channeled leaves 2 or 3 of them with auricled sheaths on the stem; heads 3 to 8-flowered on slender branches in a decompound rather contracted panicle; flowers light greenish-red over 2 lines long, sepals of nearly equal length with membranaceous margins, inner acute, outer ones acuminate; stamens 6, two-thirds the length of the sepals, long linear red-brown anthers longer than the filaments; ovary attenuated into a slender style bearing very long exsert stigmas, 1 celled; fruit and seed unknown.—San Bernardino Mountains at 4,000 feet alt. S. B. and W. F. Parish. Abundantly distinguished from the allied *J. marginatus*, with which it has in common the brown-red anthers, otherwise rare in the genus, by the stouter habit, the long coarse deeply channeled leaves, larger flowers, acute sepals, acuminate ovary, long style and stigmas. – G ENGELMANN.
